Today's Exercises

[comet-toolkit.org/user-
guide/training/lps](https://comet-toolkit.org/user-guide/training/lps)

Today's Agenda

1. Presentation: CoMet Toolkit Introduction

- ☐ *What is CoMet?*
- ☐ *Uncertainty 101*
- ☐ *Tools Intro*

2. Exercises

- ☐  **punpy** basics with in-situ type data
- ☐  **obsarray** basics with EO type data

3. “Real-life” Examples

 Today's Exercises

comet-toolkit.org/user-guide/training/lps

The CoMet Toolkit – Uncertainties made easy

Pieter De Vis, Sam Hunt, Astrid Zimmermann, Maddie Stedman
National Physical Laboratory

LPS hands-on tutorial - 22/06/2025

Presentation Outline

1. CoMet Toolkit Introduction

- ☐ *Motivation & Overview*
- ☐ *Uncertainties 101*
- ☐ *CoMet Packages*
 -  **punpy**
 -  **obsarray**
- ☐ *Application examples*

Today's Exercises

comet-toolkit.org/user-guide/training/lps

Measurements in Society

- ❑ Critical for **health**, **manufacturing**, and **environmental** monitoring.
- ❑ Growing in **size** and **complexity**.
- ❑ Reliable interpretation requires **uncertainty and error-covariance** information, often overlooked or non-standardised.

Why do we care about error-correlation?

Uncertainties 101

Error Correlation

What is Error Correlation?

Errors in a dataset are **not always independent** — e.g., when errors in pixels, bands instruments, or time steps are systematically related.

Why does it Matter?

- ☐ Bias uncertainties persist – averaging doesn't help!
- ☐ Band ratios might off – affecting retrieval uncertainty
- ☐ Misleading confidence in trends

*Error correlation matrix from
Giering et al. 2019*

A Metrological Approach

Uncertainties are evaluated and expressed following [QA4EO Five Steps](#), a framework which employs the principles of metrology.

$$y = f(x_1, x_2, x_3) + 0$$

		Comments
Name of effect		A unique name
Affected term in measurement function		Name and standard symbol
Instruments in the series affected		List names
Correlation type and form	Pixel-to-pixel [pixels]	From a set of defined correlation forms
	from scanline to scanline [scanlines]	
	between images [images]	
	Between orbits [orbit]	
	Over time [time]	
Correlation scale	Pixel-to-pixel [pixels]	As needed to define type
	from scanline to scanline [scanlines]	
	between images [images]	
	Between orbits [orbit]	
	Over time [time]	
Channels/bands	List of channels / bands affected	Channel names
	Error correlation coefficient matrix	A matrix
Uncertainty	PDF shape	Functional form
	units magnitude	Units
Sensitivity coefficient		Value, equation or parameterisation of sensitivity of measurand to term

```

CoMet Packages:

 punpy

Propagating Uncertainties with

- ❑ Python module for propagating **random**, **systematic** and **structured uncertainties** through any Python measurement function
- ❑ Flexible in terms of the **specified correlations** along given dimensions or between input quantities
- ❑ **Monte Carlo** and **Law of Propagation of uncertainties** methods available

Punpy as a Standalone Tool

❑ Simple user **interface**:

1. Import punpy
2. Define measurement function
3. Create MC or LPU object
4. Propagate uncertainties

```
import punpy
prop=punpy.MCPropagation(10000)
unc_measurand=prop.propagate_random(measurement_func,
                                     [input_qt1,input_qt2],[unc_qt1,unc_qt2])
```

❑ **Measurement function** are defined as python functions that take arrays as input quantities and return an array as measurand

❑ Many optional **keywords** for flexible functionality

- *return_corr*
- *Corr_between*
- *Repeat_dims*
- *Parallel_cores*
- *Output_vars*
- ...

Punpy with digital effects tables

- ❑ **punpy** interfaces with **obsarray** to make uncertainty propagation as efficient and easy to use as possible
- ❑ **propagate_ds()** function returns an **obsarray** dataset with combined random, systematic and structured uncertainties on measurand

```
from punpy import MeasurementFunction

# Define your measurement function inside a subclass of MeasurementFunction
class IdealGasLaw(MeasurementFunction):
    def meas_function(self, pres, temp, n):
        return (n * temp * 8.134) / pres

# create object of the measurement function class and specify the variable names
gl = IdealGasLaw(["pressure", "temperature", "n_moles"], "volume", yunit="m^3")

# propagate uncertainties on the input quantities in ds to measurand in ds_y
ds_y = gl.propagate_ds(ds)
```

 CoMet Packages:

 obsarray

Error-Covariance Metadata

Error-covariance matrices **grow quadratically** with the size (N) of observation variables, making storage impractical for large datasets.

Instead, **compact parameterisation** of error-correlation matrices by defining specific structure.

Parameterisation Defined by 3 Values:

1. **Form:** Name of the parameterisation defining its functional structure
2. **Params:** List of parameters describing the matrix (e.g., bandwidth for banded matrices).
3. **Units:** Physical units associated with parameters in the list.

Can define a separate parameterisation per dimension!

Error-Covariance Metadata

Error-covariance matrices **grow quadratically** with the size (N) of observation variables, making storage impractical for large datasets.

Instead, **compact parameterisation** of error-correlation matrices by defining specific structure.

Form	Parameters	Matrix Structure	Description
<code>random</code>	None	Identity Matrix	No error-correlation between elements in observation variable.
<code>systematic</code>	None	Full matrix of 1's	Full error-correlation between elements in observation variable.
<code>err_corr_matrix</code>	[<code>err_corr_matrix_var</code>]	Explicitly defined matrix	User defined error-correlation matrix, stored in data variable with name <code>err_corr_matrix_var</code> .

associated with

Metadata:

- PDF Shape – “gaussian”
- Units – %
- Error-Correlation:
 - All dims - Random

Metadata:

- PDF Shape – “rectangular”
- Units – “K”
- Error-Correlation:
 - **x, y** – systematic
 - **time** – defined by matrix

Example – Temperature Dataset

```
variables:
  float temperature(time, lat, lon);
    temperature:unc_comps=["u_calibration", "u_noise"];
    temperature:units="K"
  float u_calibration(time, lat, lon);
    u_calibration:units="K";
    u_calibration:pdf_shape="rectangular";
    u_calibration:err_corr_dim1_name=["lat", "lon"];
    u_calibration:err_corr_dim1_form="systematic";
    u_calibration:err_corr_dim2_name="time";
    u_calibration:err_corr_dim2_form="err_corr_matrix";
    u_calibration:err_corr_dim2_params=["err_corr_calibration_time"];
  float u_noise(time, lat, lon);
    u_calibration:err_corr_dim1_name=["time", "lat", "lon"];
    u_calibration:err_corr_dim1_form="random";
  float err_corr_calibration_time(time, time);
```

Measurement data handling in Python

- ❑ **obsarray** is an extension to xarray to support defining, storing and interfacing with measurement data – using the UNC specification.
- ❑ Also has functionality for defining flags following **CF Conventions**.
- ❑ It is designed to work well with netCDF files and for the **Earth Observation** community.

Plugs straight into punpy for propagation through measurement functions!

Comet Application Examples

CoMet Toolkit in Action

- ❑ Validated against **NIST** uncertainty engine:

https://colab.research.google.com/github/comet-toolkit/comet_training/blob/main/NIST_example.ipynb

- ❑ CoMet is used in various other projects, such as **QA4EO**, **HYPERNETS**, **CHIME L2**, **FLEX** validation, **TRUTHS** science studies, **LIME**, **FRM4SOC**, **RPV4PICS**

- ❑ **Example** from *hypernets_processor*:

Hypernets is an automated network of in-situ instruments measuring reflectance for L2 satellite validation

CoMet Release

❑ V1.0 of Comet toolkit has been released as **open source** toolkit:

- www.comet-toolkit.org
- github.com/comet-toolkit

❑ Accompanied by training material (**Jupyter** notebooks hosted on google colab):

- www.comet-toolkit.org/examples

❑ Documentation & ATBD for individual tools:

- obsarray.readthedocs.io/en/latest/
- punpy.readthedocs.io/en/latest/
- comet-maths.readthedocs.io/en/latest/

Outlook

- ❑ **Current release** will be presented De Vis & Hunt (in prep)

- ❑ Looking to continue to expand the use cases the developed tools
 - Aiming to enable uncertainty propagation through **any python measurement function**
 -  Please get in touch if you are interested!

- ❑ This has been our first step into this way of working, **many more ideas in a roadmap** to building up a comprehensive set of tools
 - e.g. retrieval tool/optimisation, BRDF tool, Look-up tables for faster processing, etc.

Summary

- ❑ The **CoMet toolkit** is an open-source software project to develop Python tools for the handling of error-covariance information in the analysis of measurement data
- ❑ This toolkit is based on **robust metrology**, and makes dealing with complexities of uncertainties much easier
- ❑ Includes **obsarray**, **punpy** & **comet_maths** as initial offering, to be extended
- ❑ These tools are already being used operationally in various projects (e.g. Hypernets)
